

Beyond AI Cameras

A reusable AI infrastructure for
everyday police operations

From surveillance modernisation to department-wide
AI-assisted policing

AI assists. Police decide.

The core argument

The camera project is not a single-purpose surveillance system.

**Phase 1 installs the operational backbone.
Every next use case increases the value of that same investment.**

We are not proposing a closed VMS product. We are proposing a sovereign AI infrastructure layer for Bangladesh Police.

1

Compute

servers, GPU capacity, edge nodes

2

Control

user authentication, role-based dashboards

3

Evidence

storage, archives, audit trails

4

AI delivery

data pipelines and model deployment

The deeper problem is information

Police work is information-heavy, repetitive, and time-sensitive.

- **Paperwork load**
Manual drafting, repeated summaries, missing fields
- **Alert noise**
Disconnected notifications without incident context
- **Slow evidence search**
Hours spent scrubbing footage and old records
- **Inconsistent guidance**
Citizens and junior officers depend on memory
- **Weak visibility**
Senior officers lack clean summaries and audit trails

One backbone, many police missions

The same foundation supports surveillance, investigation, administration, and public service.

Camera AI & VMS

Admin + Training

Citizen Service

Shared Police AI Infrastructure

Command Centre

Forensic Search

GD / FIR Drafting

Knowledge Assistant

Every new use case lowers the effective cost of the original infrastructure investment.

Seven Police AI capability layers

Modular services built on the same secured AI backbone.

01 Knowledge

SOPs, circulars, manuals, approved procedures

02 Drafting

GD, FIR, case notes, missing field checks

03 Forensics

Natural language search over video metadata

04 Command

Alert grouping, escalation, shift handover

05 Citizen service

Bangla-first guidance and request routing

06 Administration

Rosters, memos, inventory, fleet summaries

07 Training

SOP quizzes, response simulation, onboarding

No separate AI island is required.

Knowledge and drafting assistance

Reduce paperwork load while keeping officers in control.

CAPABILITY LAYER 01

Police Knowledge Assistant

Search approved manuals, SOPs, circulars, court formats, traffic rules, duty procedures, and emergency protocols in plain Bangla or English.

CAPABILITY LAYER 02

GD / FIR / Case Drafting

Officer notes become structured drafts. The system flags missing fields, extracts entities, and waits for officer approval.

Officer notes → AI structures → gaps flagged → officer approves → audit trail

Forensic Investigation Assistant

Turn archived video and metadata into searchable evidence intelligence.

Investigators search in natural language:

"Find the white microbus after 8 PM."

"Show where this person appeared after leaving the station."

"Search for a man in a black shirt carrying a backpack."

Outcome: direct video bookmarks, timeline reconstruction, and faster movement from footage to leads.

Command Centre Automation

Detection is not enough. Alerts must become accountable incidents.

**One incident card instead of
15 disconnected notifications.**

Detect

AI alerts and sensor
events

Group

related camera and
location signals

Verify

video context and map
view

Act

response checklist and
escalation

Report

handover summary and
audit trail

Citizen Service Assistant

Controlled public-facing guidance, Bangla-first, with strict data boundaries.

What it can support

- complaint procedure guidance
- lost item reporting support
- traffic fine inquiry guidance
- service desk routing
- future voice and call-centre integration

Sensitive police data is never exposed to the public assistant.

Internal administration and training

Modernisation also means reducing internal friction.

Governance and control

This section is not optional. It is the trust architecture.

1

Human-in-the-loop

AI assists, summarises, detects, drafts, searches, and alerts. Officers verify, approve, decide, act, and record final judgement.

2

Audit trail

Every search, result, approval, edit, and escalation is logged for accountability.

3

Data ownership

Operational data, evidence, face-data, case references, citizen interactions, and generated summaries remain under police control.

4

Security boundaries

On-premise deployment, role-based access, encryption, no uncontrolled third-party cloud, separate internal and public systems.

AI makes no arrests, accusations, FIR approvals, or legal decisions.

Phased roadmap

Build the backbone once. Expand capability step by step.

**One sovereign AI backbone.
Many police missions.**

Bangladesh Police does not need a separate AI system for every department. One secure infrastructure layer can support camera intelligence, investigation, command centre operations, citizen service, and internal administration.
